

Computer Programming

Introduction to Computer Programming

Willy Picard, Jacek Chmielewski

Department of Information Technology
The Poznan University of Economics
<{picard, jchmiel}@kti.ae.poznan.pl>

Agenda

- ▶ Lecture Goal(s)
- ▶ From Assembler to Java
- ▶ Programming “styles”
- ▶ Interpret vs compile
- ▶ Conclusions

Lecture Goal(s)

Overall Goal

- ▶ To introduce fundamental concepts of computer programming
- ▶ To provide programming knowledge about Java

Lectures Overview

Fundamental Concepts

- ▶ 1: Introduction
- ▶ 2: Basic data structures & Statements
- ▶ 3: Object-oriented programming I
- ▶ 4: Object-oriented programming II
- ▶ 5: Object-oriented programming III
- ▶ 6: Complex data structures
- ▶ 7: Threads & Exception handling

Lectures Overview

Java

- ▶ 8: Summarizing example
- ▶ 9: Standard packages
- ▶ 10: GUI – AWT
- ▶ 11: GUI – Swing
- ▶ 12: IO programming
- ▶ 13: Network programming
- ▶ 14: Java archives
- ▶ 15: Conclusions

Today's Goal

Introduce
fundamental concepts
of computer
programming

From Assembler to Java

Princeton vs Harvard

- ▶ Harvard architecture
 - ▶ Data and programs stored separately
 - ▶ ENIAC 1946
- ▶ Princeton architecture
 - ▶ Data and programs stored in the same way
 - ▶ A.k.a the von Neumann architecture

The Princeton Architecture

Advantages

- ▶ Many jobs for a given computer
 - ▶ Not hardwired programs
- ▶ Programs generated by programs
 - ▶ From source (data) to code (program)
- ▶ Self-modifying code

Assembler

- ▶ CPU Instructions Set Architecture
 - ▶ Instructions
 - ▶ Resources accessible to the instructions
 - ▶ Registrers
 - ▶ Functional units
 - ▶ Memory
 - ▶ I/O devices
- ▶ Assembler
 - ▶ Symbolic names

Assembler Example

- ▶ $x := y + z$
- ▶ `movl y, %eax`
- ▶ `movl z, %edx`
- ▶ `leal (%edx, %eax), %ecx`
- ▶ `movl %ecx, x`

Assembler Pros and Cons

- ▶ Low level control
 - ▶ Speed
-
- ▶ Code not portable
 - ▶ Too many details
 - ▶ Hard to maintain
 - ▶ Compilers better at producing large code

**Programming languages
are a necessity!!!**

Java

- ▶ Java Virtual Machine
 - ▶ Java Virtual Machine specification
 - ▶ Java language
 - ▶ Java development tools
 - ▶ Java Libraries
 - ▶ GUI
 - ▶ Network
 - ▶ IO

Java Example

- ▶ Build a new window

- ▶ `import javax.swing.*;`

- ▶ `...`

- ▶ `JFrame frame = new JFrame("A Window");`

- ▶ `frame.pack();`

- ▶ `frame.setVisible(true);`

Assembler Example

- ▶ $x := y + z$
- ▶ `movl y, %eax`
- ▶ `movl z, %edx`
- ▶ `leal (%edx, %eax), %ecx`
- ▶ `movl %ecx, x`

Java Pros and Cons

- ▶ Low level control
 - ▶ Speed
-
- ▶ Code portable
 - ▶ Many hidden details
 - ▶ Relatively easy to maintain

**Let's use high-level
programming languages**

Programming “Styles”

Language Classification

- ▶ Declarative Languages

- ▶ Functional

Lisp, XSLT

- ▶ Logic programming

Prolog

- ▶ Procedural Languages

- ▶ Imperative

Fortran, Pascal, Basic, C

- ▶ Object-Oriented

C++, ADA, Java

Declarative Languages

- ▶ Relationships between variables in terms of
 - ▶ Functions
 - ▶ If student is attending “Computer Programming”, her/his satisfaction equals 1, otherwise 0.
 - ▶ $f_{satisfaction} = \begin{cases} 1, & \text{if attending "Computer Programming"} \\ 0, & \text{otherwise} \end{cases}$
 - ▶ Inference rules
 - ▶ 1. Either student is attending “Computer Programming” or student is sad
 - ▶ 2. The student is not sad,
 - ▶ Then student is attending “Computer Programming”
 - ▶ Formally: $((A \text{ OR } B) \ \& \ \text{not } B) \Rightarrow A$

Procedural Languages

- ▶ Specify explicit sequences of steps to follow to produce a result
 - ▶ Manipulation of the state of the computer system
 - ▶ Potential side effects

```
private static int counter=0;  
public int getCounterValue() {  
    return counter++;  
}
```

Iteration

- ▶ Repetition of a sequence of instruction
 - ▶ a set of initial conditions
 - ▶ an iterative step
 - ▶ a termination condition
- ▶ Loops in procedural languages

Iteration Example

► Factorial

► $n! = 1 \times 2 \times 3 \times 4 \times \dots \times n$, if $n \neq 0$, 1 otherwise

```
public int factorial(int n) {  
    if (n == 0)  
        return 1;  
    int factorial = 1;  
    for (int i = 1; i < n+1; i++) {  
        factorial = factorial*i;  
    }  
    return factorial;  
}
```

Recursion

- ▶ A function or procedure calls itself
 - ▶ a callback to itself
 - ▶ a termination condition
- ▶ Functional programming

Recursion Example

- ▶ Factorial
- ▶ $n! = 1 \times 2 \times 3 \times 4 \times \dots \times n$, if $n \neq 0$, 1 otherwise

```
public int factorial(int n) {  
    if (n == 0)  
        return 1;  
    return n*factorial(n-1);  
}
```

Recursion vs Iteration

- ▶ Recursion and iteration are equivalent
 - ▶ Each recursion can be expressed as an iteration and vice-versa
- ▶ Recursion cons
 - ▶ Uses more resources
 - ▶ Often slower because of many procedure calls
- ▶ Recursion pros
 - ▶ Usually smaller
 - ▶ Often better adapted to algorithms
 - ▶ Better adapted to some data structures (trees)

Compile vs Interpret

Syntax and Semantics

► Syntax

- The structural rules of a language that determine the form of a program written in the language
- e.g. in Java, integer variable names can be followed by two adjacent + symbols

► Semantics

- The meaning of the various language constructs in the context of a given program
- e.g. in Java, '`j = i++;`' means "increment i after assigning its value to j"

Compilation

- ▶ Transformation
 - ▶ from source code
 - ▶ Written by programmer in a programming language
 - ▶ to object code
 - ▶ Directly executable by a computer
- ▶ Syntax and semantics verification
- ▶ Generated program
 - ▶ executable
 - ▶ for a given architecture

Interpretation

- ▶ Execution of source code
- ▶ Slower than execution of compiled program
- ▶ Faster than compilation+execution
 - ▶ Well-adapted to prototyping and testing
- ▶ Does not rely on a specific architecture
- ▶ Controlled environment (the interpreter)

Hybrid

- ▶ Two phases
 - ▶ Compilation to byte-code
 - ▶ Interpretation of byte-code
- ▶ Byte-code
 - ▶ Optimized and compressed representation of the source code
 - ▶ Not machine executable
 - ▶ Does not rely on a particular hardware
 - ▶ Interpreted by a Virtual Machine

The Java Case

- ▶ An hybrid approach
- ▶ First, compilation
 - ▶ `javac MyProg.java`
 - ▶ Creation of `MyProg.class`
- ▶ Next, interpretation
 - ▶ `java MyProg`
 - ▶ `MyProg.class` is interpreted
- ▶ Java Virtual Machine
 - ▶ Portability

Conclusions

Conclusions

- ▶ Many existing programming languages
 - ▶ From Assembler
 - ▶ To Java
- ▶ We chose Java because
 - ▶ High-level
 - ▶ Portable
 - ▶ Widely-used
 - ▶ Relatively easy to learn 😊

Example

```
package pl.poznan.ae.compProg;

import java.util.*;

public class Sorter {
    private List _words;

    public void sort(String[] words) {
        _words = Arrays.asList(words);
        Collections.sort(_words);
    }

    public String getSortedWords() {
        String sortedString = "";
        for (int i = 0; i < _words.size(); i++) {
            sortedString += _words.get(i);
        }
        return sortedString;
    }

    public static void main(String[] args) {
        Sorter sorter = new Sorter();
        sorter.sort(args);
        System.out.println(sorter.getSortedWords());
    }
}
```

See you next week
